

Emission Profile Analysis

The emission profile for Pakistan, based on the provided data, shows a significant increase in emissions over the decades. The emissions are expected to rise from 2025 to 2070, with a compound annual growth rate (CAGR) of 4.28%.

Decade-by-Decade Breakdown

- **2020s:** The emissions during this decade are relatively low, with a value of 2.03.
- **2030s:** There's a notable increase in emissions, with a value of 4.50, representing a substantial growth compared to the 2020s.
- **2040s:** Emissions continue to rise, reaching 5.69, indicating a steady increase in greenhouse gas emissions.
- **2050s:** This decade sees a further increase, with emissions reaching 7.51, marking a significant rise in emissions.
- **2060s:** Although the growth rate slows down slightly, emissions remain high, standing at 4.70.
- **2070s:** The emissions peak at 5.72, showing a continued trend of high emissions throughout the century.

Key Emission Trends

- **Peak Emissions Year:** Emissions are expected to peak in 2070, with a value of 26168.807.
- **Mid-Century Emissions:** By 2050, emissions are expected to reach 13304.606, indicating a significant increase from the 2025 baseline.
- **Emission Composition:** The majority of emissions (83.36%) are CO₂, followed by Kyoto Gases (11.18%), and N₂O (4.57%).

Summary

Key Points:

- Emissions in Pakistan are expected to increase significantly from 2025 to 2070.
- The 2050s see the highest emissions value of 7.51.
- CO2 constitutes the largest share of emissions at 83.36%.
- Emissions peak in 2070 at 26168.807.

Waste Emissions by Pollutant

Legend for the pie chart:

- BC (Black)
- CO₂ (Red)
- N₂O (Magenta)
- NO_x (Light Blue)
- Sulfur (Yellow)
- VOC (Dark Blue)
- CH₄ (Orange)
- CO (Grey)
- NH₃ (Green)
- OC (Dark Grey)

Industrial Process Emissions by Pollutant
